Apollo Mission

Pulsack, Jacqueline

On Christmas Eve in 1968, astronaut Bill Anders shot one of the most well-known photographs of the Earth—"Earthrise," the photo that would change the way people viewed our planet. It became a symbol for the fragility of the Earth and an icon for the environmental movement that soon followed. In 1969, David Bower founded the "Friends of the Earth" association. The following year the first Earth Day was celebrated and a year after that Greenpeace was founded in Vancouver. Finally, the first UN conference on the environment took place in 1972 in Stockholm, and in the same year the first report to the Club of Rome entitled The Limits to Growth was published. The book was the first definitive study on sustainable development; for the first time, researchers clearly wrote about the limits of the Earth's natural resources. "I think it is ironic," said Anders in an interview with the Seattle Times, "that when we flew to the moon, we discovered the Earth."

...basically it is just grey and dismal here. It kind of looks like cement or a grey sandy beach.

"Mr. Anders, your picture has become the symbol of the environmental movement. Would you have expected this?" "Well, no... in fact, the photo is actually quite out of focus and not even very good."

Author's comment

The keyword "space travel" made me think about the first moon landing: "A giant step for mankind" (Armstrong). I imagined rocket engineers, astronauts, and nifty space technology. I was suprised that the photo "Earthrise," which was the result of a spontaneous snapshot, became such an important image for us earthlings.
