## The Steam Engine

Chassignet, Marina Porras

Initiated by the growing need for raw materials, the development of steam power set off a chain reaction. In order to pump pit water out of mines, steam engines were built near mining sites. Because these steam engines were powered by coal, coal mining became profitable—a mutually beneficial system. Steam power became the energy source for many machines and vehicles, making it cheaper and easier to produce commodities in large amounts. This in turn increased the demand for raw materials used to build more machines that can produce even more commodities. This interdependency accelerated during the Industrial Revolution, and provides insight into the key factors that initiated the social process that today, in turn, gives rise to the Anthropocene revolution.

### Artist's comment:

I used to think that steam engines were only used in trains, so I was surprised to learn of the importance of this machine. Humans created something very powerful from something as simple as steam. The steam engine is a good example for how humanity's constant striving for innovation and development has changed the world. It opened up new dimensions of possibility.
