Nuclear Fission

Lindemann, Christian

Nuclear fission is an example of how “small” scientific discoveries can have profoundly destructive consequences for the entire globe. The discovery of the nuclear chain reaction in a lab enabled the construction of atomic bombs and nuclear power plants—something never intended by the scientists. Science cannot absolve itself of responsibility. Research should be guided by the principle of sustainable development: each generation must act in such a way that preserves natural resources and living conditions without endangering future generations. This ensures that all people can live together and enjoy economic and social stability. In the Anthropocene, this principle is more important than ever.

Nuclear Fission - Original instruments by Otto Hahn, Lise Meitner and Fritz Straßmann: „Hahn-Meitner-Tisch“, Inv.-Nr.: 1952/71930

Artist's comment

Humans are trying to harness nature's power and use it for themselves. However, the use of nuclear energy has numerous problems. And in the case of atomic weapons, we must all hope that we never have another world war. Einstein once said: "The release of atomic energy has not created a new problem. It has merely made more urgent the necessity of solving an existing one."
