***Tipping Point***

Wilkinson, Marian. *Tipping Point*. New York: Four Corners, 2008. HD, 45 min. <https://youtu.be/e4d-BXhQS8k>.

The Arctic Ice Sea, a plate of ice roughly the size of Europe, is disappearing. Scientists say that by 2013, there will be no sea-ice left in the Arctic, causing a tipping point for climate change throughout the world. Setting out on a summer afternoon from Dartmouth in Canada, the icebreaker Louis St. Laurent sets sail for the Arctic Circle and the fabled Northwest Passage. The bleak snowy islands and frozen waters of the Passage have proved fatal to hundreds of explorers and sailors, but the Arctic is changing. Our warming earth is most dramatically revealed in this modern day journey through the Northwest Passage. As the Louis travels its unique journey, powdery sea-ice dissolves easily in front of its red steel prow. Seals and polar bears rear their young on shrinking plates of ice, and arctic birds struggle to adapt as temperatures rise. Life in the Arctic is a fine balancing act'. The forests of Alaska are surprising victims of the Arctic's melting ice. Its vast pine forests rest on a layer of solid permafrost, and when the frost melts 'the ground literally gives way'. More and more trees are leaning over as the ground buckles. More astonishingly, Canadian Coastguards predict that it will not be long before the infamous Northwest Passage will be completely ice-free. And that' is fuelling a new 'cold rush'. The business world is eyeing the vast oil and mineral reserves, until now, locked beneath the melting ice. 'Eventually things will become critical; this issue will become something that people are willing to go to war over.' (Source: [Journeyman Pictures](#) )
