

## The Maijuna: Fighting for Survival in the Peruvian Amazon

Nancy Trautmann and Michael Gilmore

### Summary

In 2015, following decades of illegal exploitation, the Maijuna indigenous group of the Peruvian Amazon and their allies successfully pushed the Peruvian Government to establish a protected area consisting of 391,039 hectares of Maijuna ancestral territory. However, this is imperiled by a government plan to build a road and development corridor through the reserve. Protecting indigenous ways of life is a matter of social justice for affected communities. It also is a matter of global health because of the vital role played by intact rainforests in stabilizing the climate and driving carbon, oxygen, and hydrological cycles—not just locally but globally.

When the loggers came, they began destroying our forest. Then, they depleted the animals. Sometimes the loggers poisoned the whole river to catch fish. We barely ate for five years. Our children went hungry because the loggers ate everything.

The Amazon Rainforest is in crisis. Logging, industrial agriculture, dam construction, oil extraction, and other forms of destruction are endangering the survival of indigenous groups and having dramatic impacts on ecosystem services that support life throughout the world. The Maijuna, an endangered indigenous group in the Peruvian Amazon, have been fighting for biological and cultural survival in the midst of these sweeping transformations imposed by broader society. With an average family income of less than two euros a day, they are searching for environmentally and socially responsible ways to earn a living in their rainforest communities.

Numbering fewer than 500, the Maijuna live in four communities accessible only by boat or a multi-day trek through the rainforest. First contacted by Jesuit missionaries in 1682, their population declined dramatically due to epidemics, fighting, and then enslavement during the rubber boom. Over the years, Maijuna traditional beliefs, language, and ways of life have been undermined by missionary teachings, the *patrón* system, ill-conceived government policies, regional society, and the formal education system.

In today's world, Maijuna interact in ever-increasing ways with broader society while striving to maintain their close relationship with the land. They hunt, fish, grow crops, and collect non-timber forest products such as fruits and medicinal plants. For income, they sell a variety of rainforest products, crops, and crafts made with palm fibers. They cut lumber to build homes and weave roofs with palm thatch.

Following decades of hardship caused by illegal logging, poaching, and other exploitation of the resources on which they depend, in 2015 the Maijuna and allies successfully pushed the Peruvian government to create a 391,039-hectare regional conservation area that legally protects their ancestral homeland. Evidence in support of this initiative was assembled through five years of participatory mapping by Maijuna from all four communities, facilitated by Michael Gilmore in his long-term community-based work with the Maijuna. The identification of more than nine hundred sites of biological and/or cultural significance demonstrated the need for a conservation area, with a remote central region serving to maintain species of ecological, economic, and cultural importance.

Empowered with co-managing their new reserve, the Maijuna have begun implementing conservation strategies designed to sustain their traditional way of life for generations to come. Instead of cutting down trees to harvest honey, for example, they have learned to sustainably raise native stingless bees in hive boxes. Rather than cutting down palm trees, they now harvest fronds and fruit while leaving the trees standing. Building on their traditional ecological knowledge (TEK), the Maijuna are collaborating with scientists to implement conservation practices

and study the resulting impacts on key wildlife species. Camera traps and GPS-based hunter tracking studies have indicated a resurgence of ecologically and culturally important wildlife, including monkeys, tapirs, jaguars, and peccaries.

Concerted efforts by the Maijuna for long-term sustainability are threatened by a government plan to build a 130-kilometer-long road and a 10-kilometer-wide development corridor directly through the heart of their new reserve. This highway, which would cross into Colombia, was declared a national priority by the Peruvian Congress in 2011 and is part of a development plan for the border area between the two countries. If built, it would bisect the conservation area, opening up its remote core for oil-palm production, colonization, and other types of development. This would imperil the natural resources on which the Maijuna depend, and destroy areas they consider to be sacred or culturally vital. Regrettably, the Maijuna have not been properly consulted on this megadevelopment project, as required by Peruvian law. Similar issues confront indigenous groups elsewhere in the Amazon. A proposed 277-kilometer road in southeastern Peru, for example, would threaten 275,000 hectares of primary rainforest. In 2017, the Peruvian Congress declared this road a national priority even though it would pass through two indigenous reserves and a national park along Peru's border with Brazil.

Development projects such as these deny the basic human rights of indigenous peoples to maintain their traditional ways of life on their ancestral homelands. In recognition of the fact that both natural and cultural resources are indispensable in sustaining indigenous ways of life, the concept of “biocultural rights” was put forward by George Mason University faculty members Cher Weixia Chen and Michael Gilmore. Applied to proposed development projects such as the construction of highways through conservation areas, recognition of biocultural rights could give holistic legal protection to biologically rich and culturally important indigenous lands.

Protecting traditional ways of life for the Majuna and other indigenous peoples is a matter of social justice, even when it conflicts with broader economic and political forces. It also is a matter of planetary health because of the

key role played by primary intact rainforests in stabilizing climate and driving carbon, oxygen, and water cycles—not just locally but globally. The Maijuna and similar indigenous cultures deserve the right to survive, and human life throughout the planet depends on granting them the right to do so.

## **About the authors:**

### **Nancy Trautmann**

Nancy Trautmann is a visiting scholar and retired Director of Education at the Cornell Lab of Ornithology (Ithaca, NY, USA) and co-founder of The Morpho Institute, a nonprofit that supports Amazon conservation through education. As a faculty member of the Educator Academy in the Amazon, she became acquainted with efforts by the Maijuna to maintain sustainable livelihoods in the heart of the Peruvian Amazon. Her Rachel Carson Center fellowship provided time for development of curriculum resources that aim to help the Maijuna protect their ancestral homeland and way of life through ecologically and culturally responsible ecotourism and education.

### **Michael Gilmore**

Michael Gilmore, PhD, is an Associate Professor in the School of Integrative Studies at George Mason University (Fairfax, VA, USA). He is also founder and President of OnePlanet, a nonprofit that partners with the Maijuna indigenous group on community-based conservation and sustainable development projects in the Peruvian Amazon. Michael has worked with the Maijuna since 1999 and helped them to establish their indigenous federation in 2004. Amongst other initiatives, he spearheaded a multi-year project with the Maijuna to map their remote ancestral territory and worked closely with them to successfully push the Peruvian Government to establish a 391,039-hectare Maijuna protected area.
