

Recollecting the “prodotti vegetali” of the Natural History Museum, University of Florence

Anna Svensson

Summary

A historical perspective is important to fostering relational knowledge and responsible use of plants in entangled local-global trajectories. This article traces the history of the nineteenth-century economic-botany collection originally displayed as the “prodotti vegetali” in the Royal Museum of Physics and Natural History, Florence (now the Botanical Section of the University of Florence Natural History Museum).

The interwoven relationship between people, plants, and place has shaped the earth’s ecology beyond the temporal span of our archives. However, centuries of European colonialism and the capitalist system it birthed (dependent on monoculture plantations and the commodification of life) has, with time, strained the interspecies fabric of life on earth to the point of what Deborah Bird Rose termed an unraveling. Similarly, the metaphor of “plant blindness” has gained momentum in recent years, expressing growing concerns about a cognitive disconnect in which plants and human reliance on them slip from view. In this context, botanical collections and their history of public display—peaking in nineteenth-century botanical museums—provides the environmental historian with a valuable record. This article follows a nineteenth-century economic-botany collection in Florence, Italy, from public display to botanical research collection, as an eloquent witness to this global reshaping in what was then a new nation within colonial networks but, as yet, without colonies.

Figure 1. A print of the gallery of vegetable products from Filippo Parlatore's 1874 catalogue *Les Collections Botaniques du Musée Royal de Physique et d'Histoire Naturelle de Florence*.

In 1874, Filippo Parlatore (1816–1877), professor of botany, published a comprehensive catalogue of the collections of the Botanical Museum in Florence, which was part of the famous Royal Museum of Physics and Natural History founded in 1775. Alongside herbaria, wax models, fossils, living collections, and a library, Parlatore dedicated a large section of the catalogue to the provenance, display, and contents of the vegetable products collection, which he described as unrivalled “except for the rich collection at Kew, made with the formidable means available to Great Britain, mistress of much of the earth” ([1874] 1992, 61; author’s translation). Botany, art, and industry merged in this gallery (figure 1). The objects were arranged botanically according to “natural families” and meticulously labelled, and Parlatore emphasized that they were always displayed alongside the “natural products” of the plant from which they were derived, so that visitors could “immediately see” the connection for themselves. Of these visitors, he repeatedly mentions the traveler, reflecting the geographical scope of the collection beyond the region and nation. Although it contained cultural objects arranged according to a public pedagogy of display, Parlatore clearly considered this a scientific collection: in a

telling footnote he referred to fuller discussions of the vegetable products in his forthcoming “Géographie botanique” (which was never published). Parlatore was an avid follower of Alexander Humboldt’s geographical approach, and when his own ambitions of global scientific travel were dashed, he focused his efforts on collecting at a global scale, bringing the world to him by enlisting the help of diplomatic, commercial, and private contacts operating within the entangled global networks of trade and empire.

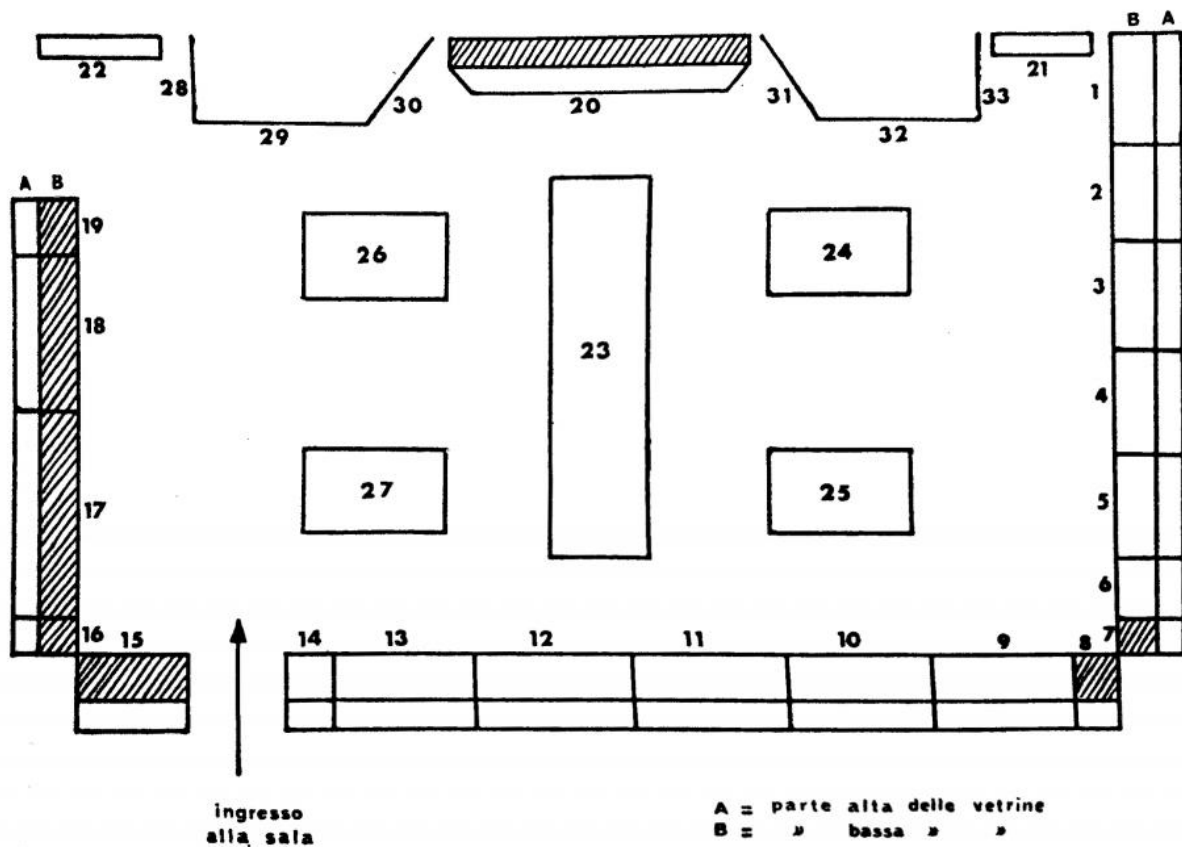

Figure 2. Map of the botanical exhibition from the 1976 visitor’s guide. Today, the displays from cabinets 6–8 and 13–20 remain intact or partially intact.

Figure 3. The pharmaceutical cabinet brings together “prodotti vegetali” and herbarium specimens for several important drugs, including cannabis, marijuana, and opium. The cotton cabinet depicts the process of production from plant to commodity, from the cotton pods to woven fabric, following the same progression as the linen display in cabinet 8.

Parlatore’s death in 1877 was followed by the fragmentation of the botanical collections—a departure from the vision of scientific universality and public pedagogy on which the museum had been founded. With the unification of Italy, the collections increasingly reflected the needs of national natural history and centralized scientific research. A research institute, which later became part of the University of Florence, was founded within the museum, organized into six departments, some of which were later relocated to other parts of the city. In the early 1880s, the botanical collections were controversially moved to their current location near San Marco

In the new location, the herbarium was expanded while the botanical collections on public display were concentrated in a single room. A visitor’s guide from 1976 provides a valuable overview of its organization and pedagogy (figure 2). It includes material familiar from Parlatore’s description—notably the cabinets on cotton and linen displaying the steps of production from plant to fabric (figure 3)—as well as updated additions

including evolution and conservation. In contrast to Parlatore's ambition towards universality or completion, this guide to the downsized museum apologetically claims that it cannot cover all aspects of botany. Instead, it offers a set of perspectives through which the visitor can explore the collections—an approach that is nonlinear and multilayered.

Figure 4. The “carpotheque” collections (continuing in the following room) housed in 33 gallery cabinets above the comings and goings in the new office spaces. Some of the palms that were displayed in the center of the Galleria dei Prodotti Vegetali are visible by the door.

In the 1990s, the Botanical Museum was closed to the public (except by appointment) and partially dismantled to make way for disabled access, office space, and growing collections. Of the museum displays still intact, some are visible, some obscured or partially dismantled. After the relocation, most of the “prodotti vegetali” were subsumed into the “carpotheque” (fruit collection, sometimes extended to cover plant material that cannot be pressed) (figure 4). Although the specimens are arranged botanically according to genus, the labels are not standardized and often give the derivative substance rather than the Latin binomial. Many plants are cultivated, domesticated, and acclimatized, and sometimes the contents of the jar cannot be definitively tied to a particular species (as in the case of indigo).

Figure 5. A selection demonstrating the diversity of the “carpotheque” collection, much of which was originally displayed in the “prodotti vegetali” exhibition: a palm leaf collected by Odoardo Beccari; the flower of *Tozzettia persica* (in spirits) grown in the botanical garden in 1854; the photograph of a wintry forest landscape in the far north of Finland (“Torneo” and “Kittila”); a dried “coloquinte” (desert gourd) from the “Exposition Vice-Royale Egyptienne”; cotton seeds from Italy’s colony of Eritrea (1903); paper flowers made of *Aralia papyrifera*; a pinecone from the type *Pinus soulangeana* bought in London, 1862; *Strychnos nux-vomica* obtained in an exchange with the Museo Tecnologico, Florence, 1878; indigo “di una pianta indigena della Confed. Argentina” donated by Sig. Durrassi in February 1868; *Trapa natans* from the “antica collezione dei museo”; fiber and fabric from *Lupinus albus*; *Eucalyptus globulus* cigarettes from a chemist in Melbourne; and a selection of beautifully presented local Tuscan flax oil.

Although no longer formally displayed, the shelves after shelves of dormant “prodotti vegetali”—ghostly orchids under dusty glass, coagulating oils, toxic warning signs, musty pickle wafts, and the delightful surprise of eucalyptus cigarettes in their original packaging—are powerfully evocative as phenomenological encounters with the material remains of past plants, people, and places (figure 5). These encounters are important to understanding the power of the pedagogy of display behind the original exhibition—bringing together plants, plant substances, and products—that enabled visitors to forge connections with plants from distant places. Yet the socioecological consequences for these places of cultivation and production remained out of sight. Ultimately, these specimens bear eloquent witness to the role of botanical science in the efforts of emerging national economies to rationalize domestic agrarian production within the increasingly dominant forces of

accelerating globalism and industrial processing, during a period just before our reliance on plants would be obscured by these same processes.

Acknowledgments

I am grateful to the C. M. Lerici Foundation and the Helge Ax:son Johnsons stiftelse for funding research visits to the Botanical Section of the Natural History Museum, University of Florence. In particular, I wish to thank Head Curator Dr. Chiara Nepi for so generously sharing her extensive knowledge of the collections, and Mark Nesbitt and Caroline Cornish at the Mobile Museum project at the Royal Botanic Gardens, Kew, for providing invaluable insights into the history of economic-botany collections and their display.

About the author:

Anna Svensson

Anna Svensson recently defended her thesis, “A Utopian Quest for Universal Knowledge: Diachronic Histories of Botanical Collections between the Sixteenth Century and the Present,” at the Division of History of Science, Technology and Environment, KTH Royal Institute of Technology, Stockholm. With a background in English literature (BA Oxford) and international museum studies (MSc University of Gothenburg), she explores how the worlds of people and plants mutually shape each other, drawing on a range of perspectives including the history of science, museology, environmental humanities, and book history. Increasingly, she is putting traditional scholarship into conversation with practice-based approaches such as floristry and natural dyeing.
