

Civilizing Nature with the Spade and the Rifle: The Engineer Battalion in the Araucanía Region, Chile (1877–1891)

Matías González Marilicán

Summary

In the second half of the nineteenth century, Chile expanded its territory for economic and political reasons, and the Araucanía region was incorporated in this context. Not only did the occupation result in an acquirement of vast tracts of lands but also in a clash with the Mapuche, the indigenous people of the region. Records suggest that behind this process, the natural environment was also affected, since Chile wanted to transform it in order to make it more habitable for settlers and more profitable for agriculture. The case of the engineer battalion, a military unit created for opening roads and constructing buildings, illustrates this point.

In the second half of the nineteenth century, Chile expanded its territory for political and economic reasons. This was the case of the Araucanía region, which was incorporated via a military campaign (1859–1884). The government wanted its fertile soils for agriculture and to exert sovereignty in a historically independent territory. Moreover, according to the Western thought of the epoch, the indigenous people of the region—the so-called Mapuche—ought to be civilized, since the prevailing thought of the day considered them a backward society.

However, records suggest that these “civilizing” efforts in the Araucanía were not only directed towards human beings, but also to the environment. This can be seen with the engineer battalion and its objective of transforming the landscape to make it more inhabitable for settlers, from 1877 to 1891—that is, from the year of its creation until its abandonment due to a Civil War in the north of Chile.

During the occupation of Araucanía, the Chilean government realized that the operation was not going to be easy due to the Mapuche resistance and the complex environment. For a long time the region was exempt from modern intervention. The Spanish failed in conquering the territory by the mid-sixteenth century, so indigenous people remained free in a region bordered by the Bio-Bio River in the north and the Toltén River in the south. This meant an absence of modern roads and a prevalence of dense mixed forests and wetlands throughout the landscape, which obstructed any foreign society interested in settling in the region. In 1870 the military commander in charge of the occupation campaign, Cornelio Saavedra, acknowledged that the forest was seriously complicating the plans of the government. It was important for the government to bring in Chilean and European settlers because they would exploit the land and thus spread civilization.

With such a reality it made sense to train army units not only to fight, but also to transform the landscape with

constructions that would facilitate the settling of the region. Thus a decree in April 1877 stated that:

It is advisable for the development of agriculture, industry, and commerce and to the best service of the military operations in the Arauco provinces, Bío-Bío and the Colonization Territory, the organization of an engineer battalion to be in charge preferably of the opening, repairmen, and conservation of public roads, bridges, telegraphs, barracks, hospitals, fortifications, and other public works to be done.

Sources show that the aims of the battalion were in general accomplished from the day of its inception. The works completed by the battalion are too numerous to be written in this study, but as an example it can be said that they constructed sewers, irrigation canals, crop fields, drain pipes, bridges, barracks, roads, telegraphs, railroads, and even boats, among other constructions that focused on the northern part of the region.

Thus the military unit was seen as a sort of lever for the progress of the region and of the Mapuche. Perhaps the most direct evidence of this thought comes from the Lieutenant Ambrosio Letelier, who refers to the engineer regiment in December 1877. He wrote:

The Chilean soldier knows how to handle the rifle, just as well as handling the pry bar and the spade, the saw and the hammer, and he is as capable of civilizing the Indians by the example of his work, as dominating them by the armed force.

Adding later:

What we need more in the Araucania are good communication networks. Open the Cholchol road, repair the roads of Contulmo, Vega Larga, the Malleco line, and the Collipulli to Mulchén line. It should be done by the engineers before next winter, beginning soon. Then we will have done more for the conquest and domination of the Araucania, than what we would have done through many years of war and combat.

Letelier's faith in the battalion was not wrong, because in the following years the unit would continue constructing devices that would help Chile consolidate its plan of civilization, surpassing natural obstacles if necessary. In 1889 the Belgium Gustav Verniory saw the military unit opening roads from Collipulli towards the Andes mountain range, and, in the same year, they helped to construct the Malleco viaduct, the tallest bridge at

that time and thus a symbol of Chilean progress. At the launch of the viaduct the president of Chile—the liberal, José Manuel Balmaceda—said: “This wonderful monument will mark the future generations of the age when Chileans shook their traditional shyness and apathy and undertook the work of a new and solid enlargement.”

In addition, the engineers eliminated forest and wetlands that interfered with communications. They felled trees on the hills of Lumaco in order to open roads, and they did the same on the Nahuelbuta mountain range between Purén and Contulmo. For Letelier, this was key for commerce. In 1877, Gregorio Urrutia, commander of the engineer battalion, trusted that his unit was capable of drying the Lumaco’s wetlands because they were the “reason for the constant humidity and, therefore, for epidemics that make the life of a town impossible.”

The case of the engineer battalion may help to understand not only the Chilean ruling class’s approach to the environment in the second half of the nineteenth century, but might also help in understanding how the current Chilean state relates with the Araucanía region and its indigenous population.

Chile. His main interest is in understanding the relationship between humans and the environment from a historical perspective, especially at a local level. Although he works in an academic context, he loves to bring environmental knowledge to wider audiences, so he can also be found teaching about nature to people of different ages through organizations like the Scouts.
