

The Remarkable Ray of Dublin's Ringsend

Cordula Scherer

Summary

The common stingray was much celebrated in the fishing village of Ringsend, county Dublin, Ireland, in the nineteenth and twentieth centuries. The village, colloquially known as “Raytown,” has a special relationship with this remarkable elasmobranch. Shared, never sold, amongst the villagers, the “towed ray” was central to their daily food supply, while also being prized for its reputed healing powers. Now gone from Dublin Bay and protected along Irish coasts, the ray remains strongly rooted in the identity of Ringsend and its local history.

Sketch plan of Dublin showing the coastline and the isolated position of Ringsend in 1673, according to Sir Bernard de Gomme's map. (The heavy line indicates the position of the old coastline.)

Ringsend in county Dublin, Ireland, is a central part of Dublin City, iconified by the striking Poolbeg chimneys. It was once a vibrant fishing village, located on the south bank of the River Liffey and east of the River Dodder, a narrow peninsula separated from the rest of Dublin by the Dodder estuary (then much broader than in current times), yet the gateway to the capital.

Ringsend was colloquially known as "Raytown" due to the popularity of "Ringsend Ray" or stingray (*Dasyatis pastinaca*), an elegant fish with a boneless skeleton that seems to fly through the water with its flattened body and large pectoral fins. Stingrays belong to the elasmobranch subclass, mainly found in coastal waters and exceptionally down to three thousand meters. Generally cosmopolitan, most elasmobranchs inhabit tropical and subtropical marine environments. Ireland's coasts are home to skates and rays, which were plentiful in Dublin Bay until the beginning of the twentieth century.

There are good reasons why people in the past would refer to Ringsend as Raytown. Ray, indeed, played an important role in the area's everyday life. Rejected elsewhere in Ireland, ray became a staple food for the people of Ringsend from the early nineteenth century, when it was landed as bycatch following the introduction of beam trawlers (Nairn et al., 2017). As records from the National Folklore Collection demonstrate, Ringsenders developed an intimate connection with this batoid, which was never sold but rather shared amongst the people of Ringsend. In 1980, "Lyrics" Murphy, a well-respected member of the Ringsend community, recalled the following remarkable story about "towed ray" from his childhood in the 1910s (UFP0482, 1980):

It was common practice that fishermen gutted the rays they caught in the last haul—only the last haul you see—cut off the wings, skinned both sides—you know Ringsend people don't eat ray with only one side skinned. They'd get a few dozen wings together to get them fast on a log line and put them over the side—you'd make a half hitch through the wings and then you towed them through the seawater to the home port for some 13 odd miles. This made the meat tender and gave it a beautiful flavour. Then, you'd put the wings on the line between the houses of our narrow streets and after 4–5 days the drying ray would become "pissy" (smelling strongly of ammonia). This was a distinctive smell in Ringsend. You needed to let the sun and wind get to them to dry them properly and you'd have wing for 6 months or more. We often ate it seven days a week—you see we couldn't afford anything else. Hunger was a good sauce in those days.

Bob Gray, born in 1911, recalls another childhood story about Ringsend's ray (UFP00089, 1980):

An old fisherman cured a child's weak limbs with buckets of small rays. The child was unable to walk, you see, and no doctor could help her. So the fisherman told the mother he'd help her. He boiled up ray skin into a jelly, gave the child ray water to drink and ray meat to eat. He massaged her weak limbs with the jelly every day for 2 weeks, you see, 2 weeks. After that the girl was running around happy and cheerful with the other children, just her legs were covered in blonde hair—hairy like a fella.

Curiously, the healing powers of ray and skates were known well beyond Ringsend. Other sources from the National Folklore Collection mention, for instance, that “local burns should be treated by rubbing the oil that comes out of a skate onto the affected area and it'll disappear.” British zoologist Francis Day noted in his 1880 book *The Fishes of Great Britain and Ireland* that Welsh fishers used ray-liver oil as a treatment for burns and other injuries.

How can we make sense of these forgotten local practices? Do these elasmobranchs indeed have healing powers? Stingrays are venomous fish, but since their venom is stored within tissue cells and has a complex secretion mechanism, scientific studies of it are limited. It is known, however, that stingray toxins induce cell death and inhibit defense enzymes in victims. In humans, this leads to increased blood flow in the superficial capillaries and cell death. This, maybe, suggests an explanation for the historical description of the ray's healing powers. The fact that stingray venom is stored in tissue cells rather than in glands might explain why the girl's weak legs were healed after being treated with ray jelly, which possibly helped the blood flow in her legs. There is also evidence that the innate immune system of elasmobranchs produces anti-bacterial properties, which might explain why people used ray-liver oil to treat local burns and other injuries.

A smiling stingray (its underside) in Portaferry Aquarium.

It has been a while since stingray abounded in Dublin Bay. In 2009, the International Union for Conservation of Nature assessed common stingray as “Near Threatened” in the entire Bay of Biscay and an EU ban on coastal trawling protects their habitat now, while most International Council for the Exploration of the Sea divisions have prohibited elasmobranch fishing since 2018 (EU 2018/120). Raytown and towed ray are history, but many grandchildren of seafaring families in Ringsend still remember their parents telling stories about fishing for crabs off the quay with the backbone of a ray. Listening to them takes us into a world in which humans and local environments were very intimately linked.

About the author:

Cordula Scherer

Dr. Cordula Scherer is a research fellow at the Trinity Centre for Environmental Humanities, Trinity College. A marine ecologist by training, her focus is the marine environment and our relationship with it. Modeling ocean productivity in the past and promoting locally sourced, sustainable seafood by revitalizing historical recipes gives her an important insight into the pivotal role of marine resources in people's daily lives. Cordula's most recent publication is "FoodSmart City Dublin: A Framework for Sustainable Seafood" (Scherer & Holm, 2020). In 2019, she won an EHCA award for Best Interdisciplinary Research in Environmental History.
